

Fresh Supplies

**Less waste. More recovered
income. Better decisions.**

Problem Statement

A quarter of every harvest never reaches a buyer. Produce is routed to the nearest market instead of the best-paying one, and fragile transport corridors compound the loss before it ever reaches a customer.

25%

spoils before sale

KES 5M+

lost value / year

WHY THIS MATTERS NOW

Every season this goes unsolved, it compounds.

Spoilage isn't a one-time loss. It's a recurring tax on every harvest, every season, compounded by produce routed to the nearest market instead of the one paying the most.

The cost, in one number

KES 5,000,000+

lost to spoilage alone, every single year, on current harvest volumes

Our Solution

We use predictive analytics and market-aware routing to connect fresh produce with the wholesale buyer that pays the most before it spoils.

1. Log the harvest

Crop, quantity, and basic storage conditions — phone app or a simple text menu.

2. Predict the risk

The system estimates spoilage risk for that batch, in seconds.

3. Recommend the market

One sentence: which nearby market pays the most before it spoils.

Built for Every Farmer

Works on any phone — smartphone or not.

Mobile App

For farmers and drivers with a smartphone — offline-first, so it works even without a live data connection, syncing automatically once back in range.

Text-Message Menu

For any phone, on any network, with no app install and no data plan required — the same predictions and market recommendation, one text at a time.

How The Prediction Works

Two signals, combined into one answer.

Storage & handling risk

How the batch has been stored and handled since harvest — temperature, time elapsed, and how fragile that crop typically is.

Transit risk

How the trip to a given market — distance, road conditions, expected duration — is likely to affect that same batch.

Combined into: what's it worth, where?

The two risks combine into one spoilage estimate per market, ranked by the money actually retained after loss — not just the closest option.

Business Value

- **Monthly Subscription:** A low, predictable platform-access fee — modeled at KES 300,000/year in the cooperative pilot.
- **Success Fee:** A share of the incremental revenue a customer actually retains, on top of the base subscription.
- **Shared Value:** We only profit meaningfully when our customers save — the incentive is aligned, not extractive.

The math, in full.

	Sold Volume	Avg Price/kg	Revenue
Baseline (today)	375,000 kg	KES 40.00	KES 15,000,000
With Fresh Supplies	412,500 kg	KES 43.20	KES 17,820,000

Annual Financial Benefit = **KES 2,820,000 / year**

526%

Year-1 ROI

~1.9 mo

Payback Period

KES 2.52M

Year-2+ Annual Savings

Assumptions

- 500,000 kg annual harvest
- KES 40/kg farm-gate value
- 25% current spoilage rate
- 30% relative spoilage reduction
- 8% price lift from better market match

Conservative, model-based estimates — see Risks (slide 10) for validation plan.

Current Status

This isn't a concept. Most of it is already running.

Backend platform and prediction engine — live

Web dashboard for cooperative and logistics staff — live

Farmer mobile app — in active development

Text-message channel — designed, build starting next

Honest caveat: the prediction model is currently calibrated on realistic, but synthetic, data. It has not yet been field-validated on this cooperative's own harvests — which is exactly what the pilot on slide 12 is for.

Risks & Mitigation

The two risks worth the board's attention.

Unvalidated real-world accuracy

Projections come from a calibrated model, not yet tested on this cooperative's actual harvests — year-one results could differ from forecast.

Mitigation: Run a 90-day pilot at one collection point first. Measure actual outcomes against the forecast before any cooperative-wide commitment.

Farmer adoption

Some farmers have limited smartphone access or connectivity, which could limit reach if the app were the only channel.

Mitigation: The text-message channel (slide 5) requires no smartphone, no app, and no data plan — every farmer can participate on any phone.

Roadmap

Three phases, each gated by proof, not hope.

MONTHS 1 -
3

Phase 1 — Pilot

One collection point. Real farmers, real harvests. Measure actual vs. predicted outcomes.

MONTH 4

Phase 2 — Evaluate

Compare pilot results to this forecast. Re-price the business case with real numbers before scaling.

MONTHS 5 +

Phase 3 — Scale

Cooperative-wide rollout, plus the text-message channel reaching farmers without smartphones.

CTA

Approve a 90-day pilot at one collection point.

Full first-year investment: KES 450,000. Projected payback: under 2 months, even at pilot scale.
Full cooperative-wide commitment — and any external partnership or investment to help fund it — comes only after the pilot proves the numbers on real harvests.

GO — phased. Low cost. Fast proof. Full rollout only after validation.
